

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

Experiment - 9

Student Name: S S Sneha

UID: 23BAI70259

Branch: BE-AIT-CSE

Section/Group: 23AIT_KRG-G1_B

Semester: 5th

Date of Performance: 31 Oct, 2025

Subject Name: ADBMS

Subject Code: 23CSP-333

1. Aim:

To understand and implement the creation and management of a relational database instance using **AWS RDS**, including setting up database connectivity (via pgAdmin or MySQL client), configuring security groups, and comparing RDS with EC2 database setups in terms of scalability, performance, and manageability.

2. Objective:

To study the concept and features of **Amazon Web Services (AWS) Relational Database Service (RDS)**.

To understand the **advantages of using RDS** over EC2 and on-premise database setups.

To learn how to **create a database instance** on AWS RDS.

To configure and manage **security groups** for secure database access.

To learn how to **connect AWS RDS to local pgAdmin or MySQL client**.

To explore various **RDS features** such as automated backups, monitoring, and scaling.

To understand **Multi-AZ deployment, read replicas, and cross-region replication** for high availability.

To gain hands-on experience in **launching and managing cloud-based databases** using AWS.

3. Theory:

Amazon Web Services (AWS) Relational Database Service (RDS) is a *managed cloud database service* that simplifies the setup, operation, and scaling of relational databases. It automates key administrative tasks such as provisioning, patching, backups, and monitoring, allowing developers to focus on application logic rather than infrastructure management.

AWS RDS supports multiple database engines, including *MySQL, PostgreSQL, MariaDB, Oracle, and SQL Server*, and provides features like *automated backups, multi-AZ deployment*, and *read replicas* to ensure high availability and reliability. Security is managed through *IAM, KMS encryption*, and *VPC security groups*, which protect databases from unauthorized access.

Additionally, AWS RDS integrates with *CloudWatch* for performance monitoring and offers *storage auto-scaling* to handle growing data needs efficiently. Compared to running databases on EC2 instances, RDS provides greater scalability, reduced administrative overhead, and enhanced performance, making it a cost-effective and reliable choice for cloud-based database management.

4. Procedure:

- Log in to the AWS Management Console using your credentials.
- Search for and open the **RDS** service from the AWS dashboard. Click on **Create Database** to start a new RDS instance setup. Choose the **Standard Create** option for manual configuration. Select the required **database engine** (MySQL or PostgreSQL).
- Enter the **DB instance name**, **master username**, and **password**. Choose the **instance class** and configure **storage settings**. Enable **storage auto-scaling** if needed. Configure **VPC** and **security groups** for database connectivity. Set the database to be **publicly accessible** (if connecting locally). Enable **automated backups** and optional **Multi-AZ deployment**. Review all settings and click **Create Database**. Wait for the instance status to become **Available** in the RDS dashboard. Copy the **endpoint** (host name) of the created database. Open **pgAdmin** or **MySQL Workbench** on your local machine.
- Create a new connection using the endpoint, username, and password. If connection fails, modify **inbound rules** in the security group to allow your local IP. Test the connection and perform basic SQL operations to verify setup.

DB instance identifier

Type a name for your DB instance. The name must be unique across all DB instances owned by your AWS account in the current AWS Region.

strugmac-DB

The DB instance identifier is case-insensitive, but is stored as all lowercase (as in "mydbinstance"). Constraints: 1 to 63 alphanumeric characters or hyphens. First character must be a letter. Can't contain two consecutive hyphens. Can't end with a hyphen.

Master username

Info

Type a login ID for the master user of your DB instance.

admin

1 to 16 alphanumeric characters. The first character must be a letter.

Credentials management

You can use AWS Secrets Manager or manage your master user credentials.

☐ Managed in AWS Secrets Manager - most secure

RDS generates a password for you and manages it throughout its lifecycle using AWS Secrets Manager.

☒ Self managed

Create your own password or have RDS create a password that you manage.

☐ Auto generate password

Amazon RDS can generate a password for you, or you can specify your own password.

Master password

Info

Password strength

Very strong

Minimum constraints: At least 8 printable ASCII characters. Can't contain any of the following symbols: / " ' @

Confirm master password

▼ View default settings for Easy create

Easy create sets the following configurations to their default values, some of which can be changed later. If you want to change any of these settings now, use Standard create.

Configuration	Value	Editable after database is created
Encryption	Enabled	No
VPC	Default VPC (vpc-081fe9fe127bb8e79)	No
Multi-AZ	No	Yes
Option group	default:mysql-8-0	Yes
Subnet group	Create new DB Subnet Group	Yes
Automatic backups	Enabled	Yes
VPC security group	default	Yes
Publicly accessible	No	Yes
Database port	3306	Yes
DB instance identifier	strugmac-DB	Yes
DB engine version	8.0.42	Yes
DB parameter group	default.mysql8.0	Yes
Monitoring type	Database Insights - Standard	Yes
Performance insights	Not enabled	Yes
Monitoring	Enabled	Yes
Maintenance	Auto minor version upgrade enabled	Yes

Application and OS Images (Amazon Machine Image)

An AMI contains operating systems, application servers, and applications that run on your EC2 instance. If you're still unsure, visit [AWS documentation](#) for more information.

Search our full catalog including 1000s of applications and OS images

Key pair (login) [info](#)

You can use a key pair to securely connect to your instance. If you don't have access to the selected key pair you launch the instance.

Key pair recommended

Proceed without a key pair (Not recommended)

6. Learning Outcomes:

Understood the concept and functionality of *Amazon RDS (Relational Database Service)*.
Learned how to *create and configure a database instance* on AWS RDS.
Gained practical knowledge of *connecting AWS RDS with local pgAdmin/MySQL Workbench*.
Understood how to *set up and modify VPC security groups* to manage inbound and outbound traffic.
Learned to *edit inbound rules* to allow database access from specific IP addresses securely.
Understood the importance of *network configuration and security* in cloud database management.
Learned to *troubleshoot common connectivity errors* like “connection timeout expired.”
Gained experience in *launching and configuring EC2 instances* for database connectivity.
Understood *differences between databases on EC2 and AWS RDS* in terms of scalability and maintenance.
Developed the ability to *deploy, manage, and secure cloud-based relational databases* effectively.
